

Dear HDR Ports & Maritime Hiring Team,

I am applying for the Ports & Maritime Project Manager position in Houston. I am a Texas-licensed Professional Engineer with 23 years of marine and offshore engineering experience, more than 10 of them leading teams and managing client projects. I want to bring that experience to HDR's port and waterfront work along the Gulf Coast.

My current work at Alan McClure & Associates is marine terminal engineering. On the \$1.8B WoodFibre LNG terminal, I led the marine global analysis for two Floating Storage Terminals berthed side-by-side. The scope covered shore mooring in extreme weather, fender and mooring interaction with LNG carriers up to 180,000 m³, and operating limits for safe berthing. I have also analyzed passing-ship effects on moored tugs and investigated mooring-line failures on moored barges. Along the Houston Ship Channel and at the Port of Corpus Christi, these same issues affect berth design, vessel traffic and terminal operations.

Your posting centers on running multidisciplinary teams, several projects at once, client relationships, staffing, financial tracking and QA/QC. That is how I have worked for most of my career. At 2H Offshore I moved from analyst to Engineering Manager and was responsible for client communication, design reviews, team coordination and delivery on more than 100 assignments. During the BP Macondo response, I led a 24/7 multidisciplinary engineering team across several locations and delivered a complete containment riser design in eight weeks. For more than 12 years I have also run an independent consulting practice. There I handle client relationships, scoping, proposals, budgets, schedules and delivery for concurrent projects for operators such as ExxonMobil, Chevron and Talos. As co-founder of Frontier Deepwater Appraisal Solutions, I have also managed business lines and company operations with full P&L responsibility, so project financials and staffing decisions are familiar ground.

Your posting also mentions advancing digital delivery and AI workflows, which is where I spend much of my own development time. I build Python and API-driven workflows that automate model setup, analysis runs and reporting. At Occidental Petroleum, I coordinated engineering, data science and software teams to deploy more than 50 physics-based algorithms monitoring about 20,000 wells. I now use AI-assisted engineering workflows with a strict rule that every published number traces back to checked, deterministic calculations. I would like to help HDR's project teams use these tools in a practical, well-controlled way.

I should be clear that my background is in marine and offshore engineering rather than port civil design. I have not been the engineer of record for wharf, bulkhead or dredging design. What I offer is a marine engineer's understanding of how vessels, moorings and berths interact, plus a proven ability to lead teams and deliver work that clients can rely on. I learn new frameworks quickly, including port-owner and USACE project delivery, and I would expect to rely on HDR's structural and coastal specialists while I manage the project.

HDR's employee-owned model appeals to me because I have spent more than a decade building a practice where my name is on the work. I would welcome the chance to discuss how I can support HDR's Ports & Maritime clients in Houston, Metairie and Corpus Christi. Thank you for your consideration.

Sincerely,

Vamsee Achanta, P.E.
